# Find Your Perfect Rental Car

The Python program we created allows users to search for their perfect rental car using the Amadeus car rental search API and what we learned this semester in IST 256.

How it Works

inputs:

User inputs Pick-up date, Drop-off date, Vehicle type, Latittude, Longitude

outputs:

System generates results and returns user with a list of locations and what vehicles are available that match the entered criteria

What We Used

1 Our program imports json data, requests, and the pretty print module.

2 The user is welcomed to the program and asked to input for 5 variables

3 A list of vehicles is returned to the user.

4 The pretty print module cleans up the results and makes them easier for the user to read
